

Training-time information flow – layer-wise role view

Depth recurrence OFF

Vanilla transformer

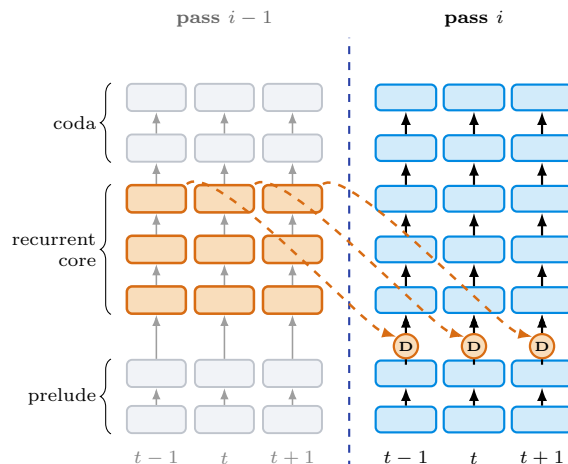

A uniform layer stack: one embedding layer, backbone layers, and one head layer.

Depth recurrence ON

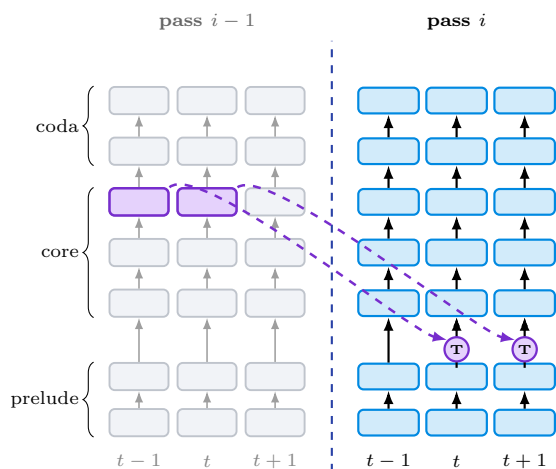

Depth-recurrent / looped LM

Recurrent-core layers emit depth state in pass $i-1$; pass i reads it before the recurrent-core band.

Temporally recurrent

The last core layer emits temporal state in pass $i-1$; pass i reads it before the core band.

Depth + temporal hybrid

Distinct roles: T-buffer, recurrent core, T-source, and coda. Temporal routing comes from T-source; depth routing comes from the top recurrent core layer.
