

Inference-time information flows

Depth recurrence OFF

Vanilla transformer

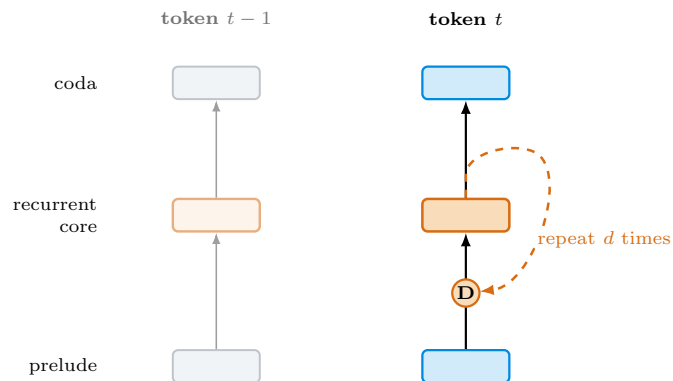

Each token is processed once; there is no temporal state and no depth loop.

Depth recurrence ON

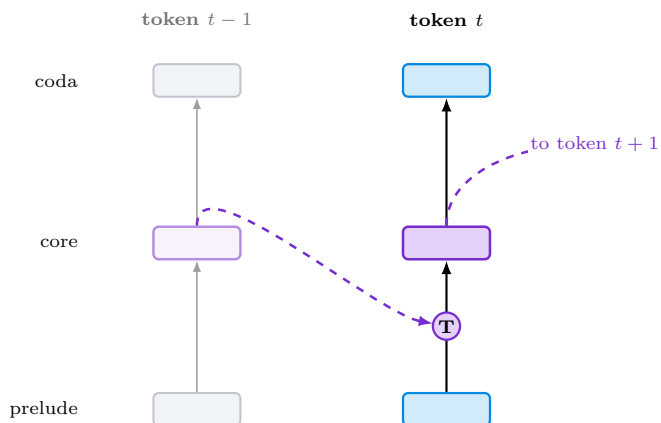

Depth-recurrent / looped

Depth state is local to each token; the shared recurrent core is reused several times within token t .

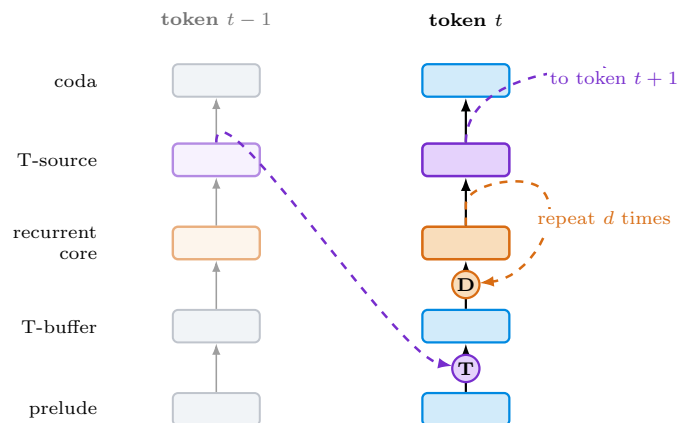

Temporally recurrent

A temporal hidden state from token $t-1$ is read while processing token t .

Depth + temporal hybrid

Temporal state crosses tokens; depth state is reused only within token t .

current-token computation

within-token flow

temporal feedback

depth recurrence

state passed to next token
